
UDDI and ebXML from One Registry

Tony Graham

Abstract

The Sun Service Registry, part of the Sun Java(TM) Enterprise System, is an ebXML Registry/Repository. As well as implementing version 3.0 of the OASIS ebXML specifications, the Service Registry includes a UDDI 3.02 Inquiry interface.

Using the Service Registry, you can query the registry using either ebXML or UDDI.

A UDDI client, an ebXML client, and a JAXR client, and a Web Browser can all access the same registry data from a Sun Service Registry.
